

## Master Branch

# git essentials

Orientation :

**git status** (files that have been changed from recent commit)  
**git diff** (changes, line by line from most recent commit)

## Another Branch

Create branch:  
**git checkout - b branch\_name**

Rename branch:  
**git branch - m existing\_name new\_name**  
 (~m means move the branch content to a new branch name)

Delete branch:  
**git branch - D branch\_name**

Merge changes from one branch to another:

(from branch you want to remain):  
**git merge branch\_name**  
**git merge -- abort** (abort merge)

(Result= *branch\_name* disappears, all commits and log history from this branch are incorporated into the branch where you execute the command.)
